

Admission & Discharge Analysis:

Evaluating Clinical Workflow & Hypertension Screening Compliance

Key Findings

01 Patients Discharge

- % discharged after hypertension screening
- Patients discharged without documented screening

02 Department Performance

- Department with the highest screening compliance
- Departments with the most missed screenings

03 Length of Stay

- Average length of stay by department
- Comparison between screened and unscreened patients

04 Patients Care Coordination

- The relationships between patients transition & hypertension screening completion
- Identified patterns that may support improved care coordination

05 Quality Performance Metrics

- Measured key workflow indicators related to hypertension screening
- Evaluated performance trends across hospital departments

Overall Analysis Report

This project evaluates the hospital admission and discharge process to determine whether patients received appropriate hypertension screening before discharge. The analysis identifies gaps in clinical workflows, screening compliance, and patient transitions to support quality improvement initiatives and reduce missed opportunities for early hypertension detection.

Analytical Methods

Data Validation	Data Transformation & Analysis	Dashboard Development
Purpose: Verified dataset completeness & remove invalid or duplicate records SQL Techniques • SELECT • WHERE • DISTINCT • IS NULL	Purpose: Combined patient records & analyze admission and discharged workflow SQL Techniques • INNER JOIN • LEFT JOIN • CASE • GROUP BY / ORDER BY	Purpose: Presented workflow & metrics through an interactive dashboard Tools • Power BI Visualizations • KPI Cards • Bar Charts • Column Charts • Slicers

SQL Analysis Results

Dashboard Insights

Conclusion & Clinical Insights

Key Clinical Insights

These findings demonstrate how healthcare analytics can improve patient safety, workflow efficiency and quality of care.

Quality Improvement Recommendations

Results suggest that standardized screening workflow before discharge may help identify patients at increase risk for hypertension and support ealrier clinical interventions.
